7. Substitute 4 for \( x \).
\[
2x = -2
\]
\[
6 - 2 = -2
\]
\[

87. Writing Exercise. By adding 13 to both sides of \[ 45 - t = 13 \] we have \[ 32 = t \]. This approach is preferable since we found the solution in just one step.

88. Writing Exercise. Since the rules for order of operations tell us to multiply (and divide) before we add (and subtract), we “undo” multiplications and additions in the opposite order when we solve equations. That is, we add or subtract first and then multiply or divide to isolate the variable.

\[ \frac{2}{9} + \frac{1}{6} = \frac{4}{18} + \frac{3}{18} = \frac{7}{18} \]

89. \[ 0.111... \]

90. \[ \frac{1}{9} \]

91. \[ 9\frac{1}{100}00 \]

92. \[ 16 \]

93. Writing Exercise. Multiply by 100 to clear decimals. Next multiply by 12 to clear fractions. (These steps could be reversed.) Then proceed as usual. The procedure could be streamlined by multiplying by 1200 to clear decimals and fractions in one step.

94. Writing Exercise. First multiply both sides of the equation by \( \frac{1}{3} \) to “eliminate” the 3. Then proceed as shown:
\[ \frac{3x + 4}{3} = -11 \]
\[ \frac{1}{3}(3x + 4) = \frac{1}{3}(-11) \]
\[ x + \frac{4}{3} = -\frac{11}{3} \]
\[ x = -\frac{15}{3} \]
\[ x = -5 \]

95. Let \( x \) represent the number of miles. Translating we have:
\[ \frac{3}{200} x + \frac{1}{4}(2) = 8 \]
Solve the equation for \( x \).
\[ \frac{3}{200} x + \frac{1}{4}(2) = 8 \]
\[ \frac{3}{200} x + \frac{1}{2} = 8 \]
\[ 200 \left( \frac{3}{200} x + \frac{1}{2} \right) = 200(8) \]
\[ 3x + 100 = 1600 \]
\[ 3x = 1500 \]
\[ x = \frac{500}{3} \]

He will drive 500 miles.
96. \[2x = x + x\]
\[2x = 2x\]  Adding on the right side
This is an identity.

97. \[x + 5 + x = 2x\]
\[2x + 5 = 2x\]
\[5 = 0\]  Subtracting 2x from both sides.
This is a contradiction.

98. \[9x = 0\]
\[9x \div 9 = 0\]
\[x = 0\]
The solution is 0.

99. \[4x - x = 2x + x\]
\[3x = 3x\]
This is an identity.

100. \[x + 8 = 3 + x + 7\]
\[x + 8 = 10 + x\]  Adding on the right side
\[x + 8 - x = 10 + x - x\]
\[8 = 10\]
This is a contradiction.

101. \[2|x| = -14\]
\[-2 \times -7 = -14\]
Since the absolute value of a number is always nonnegative, this is a contradiction.

102. \[|3x| = 12\]
This means that \(3x = -12\) or \(3x = 12\), or \(x = -4\) or \(x = 4\).

103. \[8.43x - 2.5(3.2 - 0.7x) = -3.455x + 9.04\]
\[8.43x - 8 + 1.75x = -3.455x + 9.04\]
\[10.18x - 8 = -3.455x + 9.04\]
\[10.18x + 3.455x = 9.04 + 8\]
\[13.635x = 17.04\]
\[x = 1.2497\], or \(\frac{1136}{909}\)
The solution is \(\frac{1136}{909}\), or \(\frac{1136}{909}\).

104. Since we are using a calculator we will not clear the decimals.
\[0.008 + 9.62x - 42.8 = 0.944x + 0.0083 - x\]
\[9.62x - 42.792 = -0.056x + 0.0083\]
\[9.676x = 42.8003\]
\[x \approx 4.423346424\]

105. \[-2[3(x - 2) + 4] = 4(5 - x) - 2x\]
\[-2[3x - 6 + 4] = 20 - 4x - 2x\]
\[-2[3x - 2] = 20 - 6x\]
\[-6x + 4 = 20 - 6x\]
\[4 = 20\]  Adding 6x to both sides
This is a contradiction.

106. \[0 = t - (-6) - (-7t)\]
\[0 = t + 6 + 7t\]
\[0 = 6 + 8t\]
\[-6 = 8t\]

107. \[3(x + 5) = 3(5 + x)\]
\[3x + 15 = 15 + 3x\]
\[3x + 15 - 15 = 15 - 15 + 3x\]
\[3x = 3x\]
This is an identity.

108. \[5(x - 7) = 3(x - 2) + 2x\]
\[5x - 35 = 3x - 6 + 2x\]
\[5x - 35 = 5x - 6\]
\[-35 = -6\]
This is a contradiction.

109. \[2x(x + 5) - 3(x^2 + 2x - 1) = 9 - 5x - x^2\]
\[2x^2 + 10x - 3x^2 - 6x + 3 = 9 - 5x - x^2\]
\[-x^2 + 4x + 3 = 9 - 5x - x^2\]
\[4x + 3 = 9 - 5x\]  Adding \(x^2\)
\[4x + 5x = 9 - 3\]
\[9x = 6\]
\[x = \frac{2}{3}\]
The solution is \(\frac{2}{3}\).

110. \[9 - 3x = 2(5 - 2x) - (1 - 5x)\]
\[9 - 3x = 10 - 4x - 1 + 5x\]
\[9 - 3x = 9 + x\]
\[9 - 9 = x + 3x\]
\[0 = 4x\]
\[0 = x\]
The solution is 0.

111. \[(7 - 2(8 + (-2)))x = 0\]
Since \(7 - 2(8 + (-2)) \neq 0\) and the product on the left side of the equation is 0, then \(x\) must be 0.

112. \[\frac{5x + 3}{4} \div 12 = \frac{5 + 2x}{3}\]
\[\frac{5x + 3}{4} \div 12 = \frac{5 + 2x}{3}\]
\[\frac{5x + 3}{4} + 12 = 4(5 + 2x)\]
\[15x + 9 = 20 + 8x\]
\[15x + 34 = 20 + 8x\]
\[7x = -14\]
\[x = -2\]
The solution is \(-2\).

67. \[ K = 21.235w + 7.75h - 10.54a + 102.3 \]
\[ 2852 = 21.235(80) + 7.75(190) - 10.54a + 102.3 \]
\[ 2852 = 1698.8 + 1472.5 - 10.54a + 102.3 \]
\[ 2852 = 3273.6 - 10.54a \]
\[ -421.6 = -10.54a \]

68. To find the number of 100 meter rises in \( h \) meters we divide: \( \frac{h}{100} \). Then
\[ T = t - \frac{h}{100} \]

Note that 12 km = 12 km $\cdot \frac{1000 m}{1 \ km} = 12,000 m.$

Thus, we have
\[ T = t - \frac{h}{100}, \quad 0 \leq h \leq 12,000. \]
69. First we substitute 54 for \( A \) and solve for \( s \) to find the length of a side of the cube.

\[
A = 6s^2
\]

54 = 6s^2

\[
s = \sqrt{\frac{54}{6}} = \sqrt{9} = 3
\]

Taking the positive square root

Now we substitute 3 for \( s \) in the formula for the volume of a cube and compute the volume.

\[
V = s^3 = 3^3 = 27
\]

The volume of the cube is 27 in^3.

\( 9y - 7 = 42 \)
\( 9y - 7 + 7 = 42 + 7 \)
\( 9y = 49 \)
\( \frac{9y}{9} = \frac{49}{9} \)
\( y = \frac{49}{9} \)
The solution is \(\frac{49}{9}\).

14. \( 2(t - 5) - 3(2t - 7) = 12 - 5(3t + 1) \)
\( 2t - 10 - 6t + 21 = 12 - 15t - 5 \)
\( -4t + 11 = 7 - 15t \)
\( 11t + 11 = 7 \)
\( 11t = -4 \)
\( t = \frac{-4}{11} \)

15. \( \frac{2}{3}(x - 2) - 1 = -\frac{1}{2}(x - 3) \)
\( \frac{2}{3}(2x - 2) - 1 = \frac{1}{2}(x - 3) \)
\( 4(x - 2) - 6 = -3(x - 3) \)
\( 4x - 8 - 6 = -3x + 9 \)
\( 4x - 14 = -3x + 9 \)
\( 4x - 14 + 3x = -3x + 9 + 3x \)
\( 7x - 14 = 9 \)
\( 7x = 9 + 14 \)

93. Writing Exercise. The book is marked up $30. Since Campus Bookbuyers paid $30 for the book, this is a 100% markup.

94. Writing Exercise. No, the offset is not the same because of the bases for the percents are different. In
the first case, the base is the men’s salary. In the second case, the base is women’s purchases.

If men are paid 100% and women are paid 30% less, then women are paid 70% of men’s salary. If a man is paid $100, then a woman would be paid 30% less, or $70. However $100 is not 30% more than $70. 30% more than $70 is $91.

If men are charged 30% more than women, then an item a woman bought for $100 would cost a man 30% more, or $130. However $100 is not 30% less than $130. 30% less than $130 is $91.

\[ \frac{56}{0.844} = \frac{a}{0.844} \]

\[ 66 = a \]

Note that 66 in. = 60 in + 6 in. = 5 ft 6 in. Dana’s final adult height will be about 5 ft 6 in.

97. Since 6 ft = 72 in = 6 \times 12 \text{ in.} = 72 \text{ in.}, we can express 6 ft 4 in as 72 in + 4 in, or 76 in. We reword and translate. Let $a$ be Jaraan’s final adult height.

\[ \frac{76}{0.961} = \frac{a}{0.961} \]

\[ 79 = a \]

Note that 79 in = 72 in + 7 in = 6 ft 7 in. Jaraan’s final adult height will be about 6 ft 7 in.

98. The dropout rate will decrease by 74 – 66, or 8 per thousand over 2 years (2010 to 2012).

\[ \frac{74}{1000} = \frac{66}{1000} = \frac{8}{1000} \]

\[ \frac{8}{1000} = 0.004 = 0.4\% \]

The dropout rate is about 0.4% per year.

Assuming that the dropout rate will continue to decline by the same amount each year, the estimates for 2011 and 2009 can be calculated as follows. If the drop out rate drops by about $\frac{4}{1000}$ per year, then the drop out rate in 2011 is

\[ \frac{74}{1000} - \frac{4}{1000} = \frac{70}{1000} \]

So from 2010 to 2009, the drop out rate increases by about $\frac{4}{1000}$ per year: $\frac{74}{1000} - \frac{4}{1000} = \frac{78}{1000}$.

Thus, we estimate the drop out rate to be 0.4% per year. We estimate that the drop out rate in 2009 is 78 per thousand, and the drop out rate in 2011 is 70 per thousand.

99. Using the formula for the area $A$ of a rectangle with length $l$ and width $w$, $A = l \cdot w$, we first find the area of the photo.

\[ A = 8 \text{ in.} \times 6 \text{ in.} = 48 \text{ in}^2 \]

Next we find the area of the photo that will be visible using a mat intended for a 5-in. by 7-in. photo.

\[ A = 7 \text{ in.} \times 5 \text{ in.} = 35 \text{ in}^2 \]

Then the area of the photo that will be hidden by the mat is 48 in$^2$ – 35 in$^2$, or 13 in$^2$.

We find what percentage of the area of the photo this represents.

\[ \frac{13}{48} \times 100\% = 27\% \]

The mat will hide about 27% of the photo.

100. Writing Exercise. The ending salary is the same either way. If $s$ is the original salary, the new salary after a 5% raise followed by an 8% raise is $1.08(1.05)s$. If the raises occur in the opposite order, the new salary is $1.05(1.08)s$. It would be better to receive the 8% raise first, because this increase yields a higher new salary the first year than a 5% raise. By the commutative and associative laws of multiplication we see that these are equal.

101. Writing Exercise. Suppose Jorge has $x$ dollars of taxable income. If he makes a $50 tax-deductible contribution, then he pays tax of $0.3(x - 50)$, or $0.3x - 15$ and his assets are reduced by $0.3x - 15 + 50$, or $0.3x + 35$. If he makes a $40 non-tax-deductible contribution, he pays tax of $0.3x$ and his assets are reduced by $0.3x + 40$. Thus, it costs him less to make a $50 tax-deductible contribution.

   \begin{align*}
   d + 4d & = 20.5 \\
   5d & = 20.5 \\
   d & = 4.1
   \end{align*}
   \]

\[
\begin{align*}
  g & = 83
\end{align*}
\]

If \( g \) is 83, then \( g + 19 \) is 102. The bride was 102 years old, and the groom was 83 yr old.

25. **Familiarize.** Familiarize. Let \( d \) = the number of dollars lost, in millions on *The 13th Warrior*. Then \( d + 12.7 \) is the number dollars lost, in millions on *Mars Needs Moms*.
The 13th Mars Needs Moms plus 209.3 is 209.3
\[ d + 12.7 = 209.3 \]
\[ 2d = 196.6 \]
\[ d = 98.3 \]
If \( d \) is 98.3, then \( d + 12.7 \) is 111.0.

\[ x + (x + 1) = 281 \]
Carry out. We solve the equation.
\[ 2x + 1 = 281 \]
Combining like terms
\[ 2x = 280 \]
Adding -1 on both sides
\[ x = 140 \]

Let \( s \) = the length of the shortest side, in mm. Then \( s + 2 \) and \( s + 4 \) represent the lengths of the other two sides.

Solve: \( s + (s + 2) + (s + 4) = 195 \)
\[ s = 63 \]

\[ w = 14 \]
Then \( 3w + 6 = 3 \cdot 14 + 6 = 42 + 6 = 48 \).

The billboard is 48 ft long and 14 ft wide.
33. **Familiarize.** We draw a picture. We let $x =$ the measure of the first angle. Then $3x =$ the measure of the second angle, and $x + 30 =$ the measure of the third angle.

![Diagram of angle relationships]

Recall that the measures of the angles of any triangle add up to 180°.

**Translate.**

\[
\frac{\text{measure of first angle}}{x} \quad \frac{\text{measure of second angle}}{3x} \quad \frac{\text{measure of third angle}}{x + 30} = 180°
\]

**Carry out.** We solve the equation.

\[
x + 3x + (x + 30) = 180
\]

Possible answers for the angle measures are as follows:

- First angle: $x = 30°$
- Second angle: $3x = 3(30°) = 90°$
- Third angle: $x + 30° = 30° + 30° = 60°$

**Check.** Consider 30°, 90° and 60°. The second angle is three times the first, and the third is 30° more than the first. The sum of the measures of the angles is 180°. These numbers check.

**State.** The measure of the first angle is 30°, the measure of the second angle is 90°, and the measure of the third angle is 60°.

34. Let $x =$ the measure of the first angle. Then $4x =$ the measure of the second angle, and $x + 4x - 45 =$ the measure of the third angle.

Solve: $x + 4x + (5x - 45) = 180$

If $x =$ 22.5, then $4x =$ 90, and $5x - 45 =$ 67.5, so the measures of the first, second, and third angles are 22.5°, 90°, and 67.5°, respectively.

35. **Familiarize.** Let $x =$ the measure of the first angle. Then $4x =$ the measure of the second angle, and $x + 4x + 5 =$ the measure of the third angle.

**Translate.**

\[
\frac{\text{measure of first angle}}{x} \quad \frac{\text{measure of second angle}}{4x} \quad \frac{\text{measure of third angle}}{(5x + 5)} = 180°
\]

**Carry out.** We solve the equation.

\[
x + 4x + (5x + 5) = 180
\]

If $x =$ 17.5, then $4x =$ 70, and $5x + 5 =$ 92.5.

**Check.** Consider 17.5°, 70°, and 92.5°. The second is four times the first, and the third is 5° more than the sum of the other two. The sum of the measures of the angles is 180°. These numbers check.

**State.** The measure of the second angle is 70°.

36. Let $x =$ the measure of the first angle. Then $3x =$ the measure of the second angle, and $x + 3x + 10 =$ the measure of the third angle.

Solve: $x + 3x + (4x + 10) = 180$

If $x =$ 21.25, then $3x =$ 64.75, and $4x + 10 =$ 95°. The measure of the third angle is 95°.

37. **Familiarize.** Let $b =$ the length of the bottom section of the rocket, in feet. Then $\frac{1}{6}b =$ the length of the top section, and $\frac{1}{6}b =$ the length of the middle section.

**Translate.**

\[
\frac{\text{length of top section}}{b} \quad \frac{\text{length of middle section}}{b} \quad \text{length of bottom section} = 240\text{ ft}
\]

**Carry out.** We solve the equation. First we multiply by 6 on both sides to clear the fractions.

\[
\frac{\frac{1}{6}b + \frac{1}{6}b + b}{2} = 240
\]

Then $\frac{6}{6}b + \frac{6}{6}b + b = 1440$

\[
\frac{6}{6}b + \frac{3b}{2} + b = 1440
\]

If $b =$ 144, then $\frac{1}{6}b =$ 24 and $\frac{1}{2}b =$ 144 = 72.

**Check.** 24 ft is $\frac{1}{6}$ of 144 ft, and 72 ft is $\frac{1}{2}$ of 144 ft.

The sum of the lengths of the sections is 24 ft + 72 ft + 144 ft = 240 ft. The answer checks.

**State.** The length of the top section is 24 ft, the length of the middle section is 72 ft, and the length of the bottom section is 144 ft.

Then \( \frac{1}{2} s = \frac{1}{2} \cdot 8 = 4 \) and \( \frac{3}{4} s = \frac{3}{4} \cdot 8 = 6 \). Jenny gets 8 in., Demi gets 4 in., and Joel gets 6 in.

& \quad r(2) + (r-10)(3) = 30
\end{align*}
\]

Carry out. We solve the equation.

\[
\begin{aligned}
2r + 3(r-10) & = 30 \\
2r + 3r - 30 & = 30 \\
5r - 30 & = 30 \\
5r & = 60 \\
r & = 12
\end{aligned}
\]

Then \( r - 10 = 2 \)

Check. Distance = speed \( \times \) time.
Distance downstream \( = 12 \cdot 2 = 24 \text{ mi} \)
Distance upstream \( = (12-10)(3) = 6 \text{ mi} \)
The total distance is 24 mi + 6 mi, or 30 mi.

**Carry out.** We solve the equation.

\[
\begin{align*}
2l + 2(l - 6.3) & = 99 \\
2l + 2l - 12.6 & = 99 \\
4l - 12.6 & = 99 \\
4l & = 111.6 \\
l & = 27.9

87. **Familiarize.** Let \( c \) = the amount the meal originally cost. The 15% tip is calculated on the original cost of the meal, so the tip is 0.15c.

**Translate.**
\[
\text{Original cost} + \text{tip} - \text{less } $10 = $32.55.

Carry out.  We solve the equation.

\[ 9.99 + 6.99(n - 1) + 3 + 1.5 + (n - 2) = 45.45 \]
\[ 9.99 + 6.99n - 6.99 + 4.5 + n - 2 = 45.45 \]
\[ 7.99n + 3.5 = 45.45 \]

Check.  If there are 5 DVDs, the cost of the DVDs is $9.99 + $6.99(5 - 1), or $9.99 + $27.96, or $37.95.  The cost for shipping and handling is $3 + $1.50 + $1(5 - 2) = $7.50.  The total cost is $37.95 + $7.50, or $45.45.  The answer checks.

State.  There were 5 DVDs in the shipment.

96.  Familiarize.  Let \( x \) = the number of additional games the Falcons will have to play.  Then \( \frac{3}{2}x \) = the number of those games they will win, \( 15 + \frac{x}{2} \) = the total number of games won, and \( 20 + x \) = the total number of games played.

Translate.  
\[
\begin{array}{cccc}
\text{Number of games won} & \text{is} & \text{60\% of} & \text{total number of games} \\
\downarrow & \downarrow & \downarrow & \downarrow \\
15 + \frac{x}{2} & = & 0.6 & \cdot \ 20 + x \\
\end{array}
\]

Carry out. We solve the equation.

\[
15 + \frac{x}{2} = 0.6(20 + x)
\]

\[
15 + 0.5x = 12 + 0.6x
\]

\[
15 = 12 + 0.1x
\]

\[
x = 30
\]

Check. If the Falcons play an additional 30 games, then they play a total of 20 + 30, or 50, games. If they win half of the 30 additional games, or 15 games, then their wins total 15 + 15, or 30. Since 60% of 50 is 30, the answer checks.

State. The Falcons will have to play 30 more games in order to win 60% of the total number of games.

97. Familiarize. Let \( d \) = the distance, in miles, that Mya traveled. At $0.50 per \( \frac{1}{5} \) mile, the mileage charge can also be given as 5($0.50), or $2.50 per mile. Since it took 20 min to complete what is usually a 10-min drive, the taxi was stopped in traffic for 20 – 10, or 10 min.

Translate.
The initial $2.50 stopped in plus plus is $23.80. The charge per mile traffic charge

\[
2.80 \quad 2.5 \quad 0.6(10) \quad 23.80
\]

Carry out. We solve the equation.

\[
2.80 + 2.5d + 0.6(10) = 23.80
\]

\[
2.8 + 2.5d + 6 = 23.80
\]

\[
2.5d + 8.8 = 23.80
\]

\[
2.5d = 15
\]

\[
d = 6
\]

Check. Since $2.5(6) = $15, and $0.60(10) = $6, and $15 + $6 + $2.80 = $23.80, the answer checks.

State. Mya traveled 6 mi.

98. Let \( s \) = the score on the third test.

Solve: \[
\begin{align*}
\frac{2}{3} \times 85 + x &= 82 \\
170 + x &= 246 \\
x &= 76
\end{align*}
\]

99. Writing Exercise. If the school can invest the $2000 so that it earns at least 7.5% and thus grows to at least $2150 by the end of the year, the second option should be selected. If not, the first option is preferable.

100. Writing Exercise. Yes; the page numbers must be consecutive integers. The only consecutive integers whose sum is 191 are 95 and 96. These cannot be the numbers of facing pages, however, because the left-hand page of a book is even-numbered.

101. Familiarize. Let \( w \) = the width of the rectangle, in cm. Then \( w + 4.25 = \) the length.

Translate.
The perimeter is 101.74 cm.

\[
2(4.25) + 2w = 101.74
\]

Carry out. We solve the equation.

\[
2w + 8.5 + 2w = 101.74
\]

\[
4w + 8.5 = 101.74
\]

\[
w = 23.31
\]

Then \( w + 4.25 = 23.31 + 4.25 = 27.56 \).

Check. The length, 27.56 cm, is 4.25 cm more than the width, 23.31 cm. The perimeter is 2(27.56) cm + 2(23.31 cm) = 55.12 cm + 46.62 cm = 101.74 cm. The answer checks.

State. The length of the rectangle is 27.56 cm, and the width is 23.31 cm.

102. Let \( s \) = the length of the first side, in cm. Then \( 3.25 + s \) = the length of the second side, and \((3.25) + 4.35\), or 7.6 = the length of the third side.

Solve: \[
3.25 + (3.25) + (s + 7.6) = 26.87
\]

The lengths of the sides are 5.34 cm, 5.34 + 3.25, or 8.59 cm, and 5.34 + 7.6, or 12.94 cm.

Translate.  The average of the five scores is given by
\[
\frac{73 + 75 + 89 + 91 + s}{5}.

Since this average must be at least 85, this means that it must be greater than or equal to 85.  Thus, we can translate the problem to the inequality
\[
\frac{73 + 75 + 89 + 91 + s}{5} \geq 85.
\]

Carry out.  We first multiply by 5 to clear the fraction.
\[
5 \left( \frac{73 + 75 + 89 + 91 + s}{5} \right) \geq 5 \cdot 85

\[
\frac{514234432 + 3}{10} = \frac{31}{10} = 3.1.

From these calculations, it would appear that the solution is correct.

\]

37. **Familiarize.** Let \( d \) = the depth of the well, in feet.
Then the cost on the pay-as-you-go plan is \( $500 + 8d \). The cost of the guaranteed-water plan is \( $4000 \). We want to find the values of \( d \) for which the pay-as-you-go plan costs less than the guaranteed-water plan.

**Translate.**

\[
\text{Cost of pay-as-you-go plan is less than cost of guaranteed-water plan}
\]

\[
\downarrow \quad \downarrow \quad \downarrow
\]

\[
500 + 8d < 4000
\]

**Carry out.**

\[
500 + 8d < 4000
\]

\[
8d < 3500
\]

\[
d < 437.5
\]

**Check.** We check to see that the solution is reasonable.

When \( d = 437 \), \( 500 + 8 \cdot 437 = 3996 < 4000 \)

When \( d = 437.5 \), \( 500 + 8(437.5) = 4000 \)

When \( d = 438 \), \( 500 + 8(438) = 4004 > 4000 \)

From these calculations, it appears that the solution is correct.

**State.** It would save a customer money to use the pay-as-you-go plan for a well of less than 437.5 ft.

38. Let \( t \) = the number of quarter hour units of time for a road call.
Solve: 
\[
50 + 15t < 70 + 10t
\]

\( t < 4 \)

It would be more economical to call Rick’s for a service call of less than 4 quarter hours, or of less than 1 hr.

39. **Familiarize.** Let \( v \) = the blue book value of the car.
Since the car was repaired, we know that \( $8500 \) does not exceed \( 0.8v \) or, in other words, \( 0.8v \) is at least \( $8500 \).

**Translate.**

\[
80\% \text{ of the blue book value} \geq 8500
\]

**Carry out.**

\[
0.8v \geq 8500
\]

\[
v \geq 8500
\]

**Check.** As a partial check, we show that 80% of \( $10,625 \) is at least \( $8500 \):

\[
0.8(10,625) = 8500
\]

**State.** The blue book value of the car was at least $10,625.

40. Let \( c \) = the cost of the repair.
Solve: 
\[
c > 0.8(21,000)
\]

\[
c > 16,800

41. **Familiarize.** Let \( L \) = the length of the package.

**Translate.**

\]

\[
\downarrow \quad \downarrow \quad \downarrow \quad \downarrow
\]

\[
L + 29 < 84
\]

\[
L < 55
\]

**Check.** We check to see if the solution seems reasonable.

When \( L = 60, 60 + 29 = 89 \) in.

When \( L = 55, 55 + 29 = 84 \) in.

When \( L = 50, 50 + 29 = 79 \) in.
From these calculations, it would appear that the solution is correct.

**State.** For lengths less than 55 in, the box is considered a “package.”

</tbody>
</table>

Substituting \( \frac{9}{5} C + 32 \) for \( F \), we have

\[
\frac{9}{5} C + 32 > 98.6.
\]

**Carry out.** We solve the inequality.

\[
\begin{align*}
\frac{9}{5} C & > 66.6 \\
C & > 33.3 \\
C & > 37
\end{align*}
\]

**Check.** We check to see if the solution seems reasonable.

- When \( C = 36 \), \( \frac{9}{5} \cdot 36 + 32 = 96.8 \).
- When \( C = 37 \), \( \frac{9}{5} \cdot 37 + 32 = 98.6 \).
- When \( C = 38 \), \( \frac{9}{5} \cdot 38 + 32 = 100.4 \).

It would appear that the solution is correct, considering that rounding occurred.

**State.** The human body is feverish for Celsius temperatures greater than 37°.

\[
\begin{align*}
\frac{1}{2} (8)h & \leq 12 \\
4h & \leq 12 \\
h & \leq 3

**Check.** As a partial check, we show that a length of 3 ft will result in an area of 12 ft².

\[

**State.** The height should be no more than 3 ft.

### 46. Let \( h \) = the length of the triangle

**Check.** As a partial check, we show that 12 g of fat does not exceed 75% of 16 g of fat:

\[0.75(16) = 12\]

**State.** A serving of regular peanut butter contains at least 16 g of fat.

### 48. Let \( r \) = the amount of fat in a serving of the regular cheese, in grams.

**Solve:** \( 5 \leq 0.75 r \) (See Exercise 47.)

\[

\[ 73.9 + 1.1t > 90 \]
\[ 1.1t > 16.1 \]

\[ 2004 + 15 = 2019 \]

Check. As a partial check, we can show that the number of dogs is 90 million 15 years after 2004.

\[ 73.9 + 1.1 \times 15 = 73.9 + 16.5 = 90.4 \]

State. The there will be more than 90 million dogs living as household pets in 2019 and after.

50. Let \( w \) = the number of weeks after July 1.

\[ w \geq 6 \]

The water level will not exceed 21 ft for dates at least 6 weeks after July 1, or on August 12 and later.

51. Familiarize. Let \( n \) = the number of text messages.

The total cost is the monthly fee of $1.99 each day for 22 days, or \( 1.99 \times 22 = $43.78 \), plus 0.02 times the number of text messages, or 0.02\( n \).

Translate.

\[ \text{Day fee plus text messages exceed } 560 \]

\[ \downarrow \downarrow \downarrow \downarrow \]

\[ $43.78 + 0.02n \leq 60 \]

Carry out. We solve the inequality.

\[ 43.78 + 0.02n \leq 60 \]
\[ 0.02n \leq 16.22 \]
\[ n \leq 811 \]

Check. As a partial check, if the number of text messages is 811, the budget of $60 will not be exceeded.

53. Familiarize. We will use the formula

\[ R = -0.0065t + 4.3259. \]

Translate.

\[ \text{The world record is less than } 3.6 \text{ minutes.} \]

\[ \downarrow \downarrow \downarrow \downarrow \]

\[ -0.0065t + 4.3259 < 3.6 \]

Carry out. We solve the inequality.

\[ -0.0065t + 4.3259 < 3.6 \]
\[ -0.0065t < -0.7259 \]
\[ t > 111.68 \]

Check. As a partial check, we can show that the record is more than 3.6 min 111 yr after 1900 and is less than 3.6 min 112 yr after 1900.

For \( t = 111 \), \( R = -0.0065(111) + 4.3259 = 3.7709 \).

For \( t = 112 \), \( R = -0.0065(112) + 4.3259 = 3.5979 \).

State. The world record in the mile run is less than 3.6 min more than 112 yr after 1900, or in years after 2012.

54. Solve: \[-0.0026t + 4.0807 < 3.7 \]

The world record in the 1500-m run will be less than 3.7 min more than 146 yr after 1900, or in years after 2046.

55. Familiarize. We will use the equation

\[ y = 0.122x + 0.912. \]

57. Writing Exercise. Answers may vary. Fran is more than 3 years older than Todd.

58. Writing Exercise. Let \( n \) represent “a number.” Then “five more than a number” translates to \( n + 5 \), or \( 5 + n \), and “five is more than a number” translates to \( 5 > n \).

64. Writing Exercise. Answers may vary.

Acme rents a truck at a daily rate of $46 plus $0.43 per mile. The Rothmans want a one-day truck rental, but they must stay within an $85 budget. What mileage will allow them to stay within their budget?
65. **Familiarize.** We use the formula \( F = \frac{9}{5}C + 32 \).

**Translate.** We are interested in temperatures such that \( 5^\circ F < C < 15^\circ \). Substituting for \( F \), we have:

\[
5 < \frac{9}{5}C + 32 < 15
\]

**Carry out:**

\[
\frac{9}{5}C + 32 < 15
\]

\[
5 < \frac{9}{5}C + 32 < 15
\]

\[
5 - 5 < \frac{9}{5}C + 32 - 5 < 15 - 5
\]

\[
25 < 9C + 160 < 75
\]

\[
-135 < 9C < -85
\]

\[
-15 < C < -\frac{4}{9}
\]

**Check.** The check is left to the student.

**State.** Green ski wax works best for temperatures between \(-15^\circ \)C and \(-\frac{4}{9}^\circ \)C.

66. Let \( h \) be the number of hours the car has been parked.

Solve:

\[

\]

\[
h > 6 \text{ hr}
\]

67. Since \( 8^2 = 64 \), the length of a side must be less than or equal to 8 cm (and greater than 0 cm, of course). We can also use the five-step problem-solving procedure.

**Familiarize.** Let \( s \) represent the length of a side of the square. The area \( s \) is the square of the length of a side, or \( s^2 \).

**Translate.**

The area is no more than 64 cm\(^2\).

\[
s^2 \leq 64
\]

**Check.** Since the length of a side cannot be negative we only consider positive values of \( s \), or \( 0 < s \leq 8 \). We check to see if this solution seems reasonable.

When \( s = 7 \), the area is \( 7^2 \), or 49 cm\(^2\).

When \( s = 8 \), the area is \( 8^2 \), or 64 cm\(^2\).

When \( s = 9 \), the area is \( 9^2 \), or 81 cm\(^2\).

From these calculations, it appears that the solution is correct.

**State.** Sides of length 8 cm or less will allow an area of no more than 64 cm\(^2\). (Of course, the length of a side must be greater than 0 also.)

68. Because we are considering odd integers we know that the larger integer cannot be greater than 49. (51 + 49 is not less than 100.) Then the smaller integer is 49 - 2, or 47. We can also do this exercise as follows:

Let \( x = \) the smaller integer. Then \( x + 2 = \) the larger integer.

Solve: \( x + (x + 2) < 100 \)

\[
x < 49
\]

The largest odd integer less than 49 is 47, so the integers are 47 and 49.

69. **Familiarize.** Let \( p \) = the price of Neoma’s tenth book.

If the average price of each of the first 9 books is $12, then the total price of the 9 books is $9 \times 12$, or $108. The average price of the first 10 books will be \( \frac{108 + p}{10} \).

**Translate.**

The average price of the first 10 books is at least $15.

\[
\frac{108 + p}{10} \geq 15
\]

**Check.** As a partial check, we show that the average price of the 10 books is $15 when the price of the tenth book is $42.

\[
\frac{108 + 42}{10} = \frac{150}{10} = 15
\]

**State.** Neoma’s tenth book should cost at least $42 if she wants to select a $15 book for her free book.

70. Let \( h \) = the number of hours the car has been parked.

Then \( h - 1 \) = the number of hours after the first hour.

Solve:

\[
14 < 4 + 2.50(h - 1) < 24
\]

\[
h > 5 \text{ hr} < h < 9 \text{ hr}
\]

71. **Writing Exercise.** Let \( s = \) Blythe’s score on the tenth quiz. We determine the score required to improve her average at least 2 points. Solving \( \frac{9}{10} \times 84 + s \geq 86 \), we get \( s \geq 104 \). Since the maximum possible score is 100, Blythe cannot improve her average two points with the next quiz.

72. **Writing Exercise.** Let \( h = \) the total purchases of hardcover bestsellers, \( n = \) the purchase other eligible purchases at Barnes & Noble.

(1) Solving \( 0.40h > 25 \), we get $62.50

(2) Solving \( 0.10n > 25 \), we get $250

Thus when a customer’s hardcover bestseller purchases are more than $62.50, or other eligible purchases are more than $250, the customer saves money by purchasing the card.

x = \frac{280}{0.3}

x = 933

Copyright © 2018 Pearson Education, Inc.

x &= \frac{1,130,000}{1.1418} \\
x &\approx 990,000
\end{align*}
\]

Check. If the number of new international students in 2014 was about 990,000, then that number plus an increase of 14.18% is 990,000 + 0.1418 \cdot 990,000, or about 1,130,000. The answer checks.

2x + 2 &= 116 \\
x &= 57
\end{align*}
\]

Check. If the first odd integer is 57, then the next consecutive odd integer would be 57 + 2 or 59. The sum of these two integers is 57 + 59, or 116. This result checks.

2x + 2(x - 6) &= 56 \\
2x + 2x - 12 &= 56 \\
4x - 12 &= 56 \\
4x &= 68 \\
x &= 17
\end{align*}
\]

Check. If the length is 17 cm, then the width is 17 cm – 6 cm, or 11 cm. The perimeter is 2 \cdot 17 cm + 2 \cdot 11 cm, or 34 cm + 22 cm, or 56 cm. These results check.

\]

\[
6 \left( \frac{98 + 89 + 110 + 85 + 83 + x}{6} \right) \leq 6 \cdot 95
\]

\[
98 + 89 + 110 + 85 + 83 + x \leq 570

\]

\[
4n \leq 59
\]

\[
n \leq \frac{59}{4}

58. Writing Exercise. Multiplying both sides of an equation by any nonzero number results in an equivalent equation. When multiplying on both sides of an inequality, the sign of the number being multiplied by must be considered. If the number is positive, the direction of the inequality symbol remains unchanged; if the number is negative, the direction of the inequality symbol must be reversed to produce an equivalent inequality.

59. Writing Exercise. The solutions of an equation can usually each be checked. The solutions of an inequality are normally too numerous to check. Checking a few numbers from the solution set found cannot guarantee that the answer is correct, although if any number does not check, the answer found is incorrect.

16. \[\frac{1}{2}t - \frac{1}{4} \leq \frac{3}{4}\]
\[\frac{1}{2}t - \frac{1}{4} \leq \frac{3}{4} - \frac{1}{2}\] Adding \(-\frac{1}{2}\)
\[-\frac{1}{4} \leq \frac{1}{4}\] Simplifying

17. \[5 - 9x \geq 19 + 5x\]
\[5 - 9x - 5 > 19 + 5x - 5\] Adding -5
\[-9x > 14 + 5x\] Simplifying
\[-9x - 5x > 14 + 5x - 5x\] Adding -5x
\[-14x > 14\] Simplifying

\[A = r\] Simplifying

The solution is \(r = \frac{A}{2\pi h}\).

19. \[w = \frac{P + l}{2}\]
\[2 \cdot w = 2\left(\frac{P + l}{2}\right)\] Multiplying by 2
\[2w = P + l\] Simplifying
\[2w - P = P + l - P\] Adding -P

We solve the equation.
\[ x = 0.185 \cdot 80 \]
\[ x = 14.8 \]
The solution is 14.8.

23. **Translate.**

What percent of 75 is 33?

\[ y \cdot 75 = 33 \]
\[ y = \frac{33}{75} \]
\[ y \approx 0.44 = 44\% \]
The solution is 44%.

24. **Translate.**

\[ y < 4 \]
\[ -4 \quad -2 \quad 0 \quad 2 \quad 4 \quad 6 \]

26. **Familiarize.** Let \( w \) = the width of the calculator, in cm. Then the length is \( w + 4 \), in cm. The perimeter of a rectangle is given by \( P = 2l + 2w \).

**Translate.**

The perimeter of the rectangle is 36.

\[ 2(w + 4) + 2w = 36 \]

**Carry out.** We solve the equation.

\[ 2w + 8 + 2w = 36 \]
\[ 4w + 8 = 36 \]
\[ 4w = 28 \]
\[ w = 7 \]

**Check.** If the width is 7 cm, then the length is \( 7 + 4 \), or 11 cm. The perimeter is then \( 2 \cdot 11 + 2 \cdot 7 \), or 22 + 14, or 36 cm. These results check.

**State.** The width is 7 cm and the length is 11 cm.

27. **Familiarize.** Let \( x \) = the distance from start. Then \( 3x \) mi is the distance to the end.

**Translate.**

Distance from start and distance to end is whole trip.

\[ x + 3x = 240 \]

28. **Familiarize.** Let \( x \) = the length of the first side, in mm. Then the length of the second side is \( x + 2 \) mm, and the length of the third side is \( x + 4 \) mm. The perimeter of a triangle is the sum of the lengths of the three sides.

**Translate.**

The perimeter of the triangle is 249 mm.

\[ x + (x + 2) + (x + 4) = 249 \]

**Carry out.** We solve the equation.

\[ x + (x + 2) + (x + 4) = 249 \]
\[ 3x + 6 = 249 \]
\[ 3x = 243 \]
\[ x = 81 \]

**Check.** If the length of the first side is 81 mm, then the length of the second side is \( 81 + 2 \), or 83 mm, and the length of the third side is \( 81 + 4 \), or 85 mm. The perimeter of the triangle is \( 81 + 83 + 85 \), or 249 mm. These results check.

**State.** The lengths of the sides are 81 mm, 83 mm, and 85 mm.

29. **Familiarize.** Let \( x \) = the electric bill before the temperature of the water heater was lowered. If the bill dropped by 7\%, then the Kellys paid 93\% of their original bill.

**Translate.**

93\% of the original bill is $60.45.

\[ 0.93 \cdot x = 60.45 \]

**Carry out.** We solve the equation.

\[ 0.93x = 60.45 \]
\[ x = 65 \]

**Check.** If the original bill was $65, and the bill was reduced by 7\%, or 0.07 \$65, or \$4.55, the new bill would be $65 – $4.55, or $60.45. This result checks.

**State.** The original bill was $65.
30. **Familiarize.** Let \( x \) = the number of trips.

**Translate.**

<table>
<thead>
<tr>
<th>Monthly pass</th>
<th>must not exceed</th>
<th>cost of individual trips</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \downarrow )</td>
<td>( \downarrow )</td>
<td>( \downarrow )</td>
</tr>
<tr>
<td>( 99 )</td>
<td></td>
<td>( 2.60x )</td>
</tr>
</tbody>
</table>

**Carry out.** We solve the inequality.

\[
99 < 2.60x \\
\frac{99}{2.60} < x \\
38.1 < x
\]

**Check.** As a partial check, we let \( x = 39 \) trips and determine the cost. The cost would be \( 39(2.60) = 101.40 \). If the number of trips were less, the cost would be under \$101.40\), so the result checks.

**State.** Gail should make more than 38 one-way trips per month.

31. \[
c = \frac{2cd}{a-d}
\]

\[
(a-d)c = (a-d)\left(\frac{2cd}{a-d}\right)
\]

Multiplying by \( a-d \)

\[
ac - dc = 2cd
\]

Simplifying

\[
ac - dc + dc = 2cd + dc
\]

Adding \( dc \)

\[
ac = 3cd
\]

Simplifying

\[
\frac{1}{3e}(ac) = \frac{1}{3e}(3cd)
\]

Multiplying by \( \frac{1}{3c} \)

\[
\frac{a}{d} = \frac{d}{3}
\]

Simplifying

The solution is \( d = \frac{a}{3} \).

32. \[
3|w| - 8 = 37
\]

\[
3|w| = 37 + 8
\]

Adding 8

\[
3|w| = 45
\]

Simplifying

\[
\frac{1}{3}(3|w|) = \frac{1}{3} \times 45
\]

Multiplying by \( \frac{1}{3} \)

\[
|w| = 15
\]

Simplifying

This tells us that the number \( w \) is 15 units from the origin. The solutions are \( w = -15 \) and \( w = 15 \).

33. Let \( h \) = the number of hours of sun each day. Then we have \( 4 \leq h \leq 6 \).

34. **Familiarize.** Let \( x \) = the number of tickets given away. The following shows the distribution of the tickets:

First person received \( \frac{1}{3}x \) tickets.

Second person received \( \frac{1}{4}x \) tickets.

Third person received \( \frac{1}{5}x \) tickets.

Fourth person received 8 tickets.

Fifth person received 5 tickets.

**Translate.**

The number of tickets the five people received is the total number of tickets.

\[
\frac{1}{3}x + \frac{1}{4}x + \frac{1}{5}x + 8 + 5 = x
\]

**Carry out.** We solve the equation.

\[
60\left(\frac{1}{3}x + \frac{1}{4}x + \frac{1}{5}x + 8 + 5\right) = 60x
\]

\[
60\left(\frac{1}{3}x + \frac{1}{4}x + \frac{1}{5}x + 13\right) = 60x
\]

\[
20x + 15x + 12x + 780 = 60x
\]

\[
47x + 780 = 60x
\]

\[
780 = 13x
\]

\[
x = 60
\]

**Check.** If the total number of tickets given away was 60, then the first person received \( \frac{1}{3}(60) \), or 20 tickets; the second person received \( \frac{1}{4}(60) \), or 15 tickets; the third person received \( \frac{1}{5}(60) \), or 12 tickets. We are told that the fourth person received 8 tickets, and the fifth person received 5 tickets. The sum of the tickets distributed is \( 20 + 15 + 12 + 8 + 5 \), or 60 tickets. These results check.

**State.** There were 60 tickets given away.
